

# ARTERIA

## WHOLE HOUSE SOLUTION

- One central touch-screen to operate all Fancom control computers
- Easy, time saving, preventing errors
- Animal data only has to be entered and changed in one place

# ARTERIA WHOLE HOUSE SOLUTION

Arteria is the new central control unit with touch-screen for operating the F2000, Lumina and Lumina Touch controllers. With the Arteria we are now able to offer a complete building solution in which one or more controllers can be operated via one central touch-screen. Central operation is time-saving, gives clear overview and prevents errors.

## Suitable for up to 3 controllers in 1 poultry house

This first version of the Arteria is suitable for use in poultry houses in combination with the Fancom climate and feeding controllers. This Arteria can operate up to 3 controllers provided they are all of a different type. In practice, this means that one poultry house can be operated with one Arteria. Later this year we are releasing a new version with more functionalities and a version designed for use in pig keeping.

## Lumina controllers without control screen

When using a central control system with the Arteria, you can opt to have screenless control computers in the poultry house. This is not only more cost-effective but also prevents accidental operation of the computers by workers in the house. It is also possible to build the entire system in a switch box.

## Data sharing

A key advantage of this central control system is that central data only has to be changed in one place. Animal data collected in different types of controllers, for example, can be automatically synchronised via the data sharing function.
